

**ENTERPRISE MEDICATION MANAGER**

# One Platform to Manage Medications Throughout the Care Continuum

Many healthcare organizations strive to improve medication safety, reduce costs, and streamline operations—all while navigating staffing shortages and evolving technology landscapes. Enterprise Medication Manager (EMM) is designed to address these challenges by delivering a centralized, intelligent platform for managing medications across the continuum of care.

Omnicell's EMM is a powerful, web-based pharmacy supply chain solution that is designed to give health systems visibility and control over medication inventory across every cabinet, facility, and automation platform.

The software is purpose-built for health systems with Centralized Service Centers or Hub-and-Spoke distribution models and offers a unique set of tools engineered to:

- Provide real-time inventory visibility
- Facilitate site-to-site medication movement
- Track costs and value across platforms and vendors
- Maintain financial and operational control across the enterprise

## Improved Visibility for Inventory Optimization

Locating medications in real time – whether within a single facility or across multiple sites – can be difficult and may create delays that impact care delivery.

EMM features a centralized dashboard with enterprise oversight that helps you find any medication within seconds and better align supply with demand. The dashboard is also designed to provide quick access to days on hand and average daily usage metrics that should promote cost savings and efficiency gains from inventory use optimization.

## Streamlined Workflows for Operational Efficiency

Managing ordering, inventory, and distribution through disconnected systems is no small task. When processes are highly manual, problems like medication expirations and shortages can create operational hurdles that impact care quality.

Streamlined workflows with transfer functionality within EMM allow users to quickly move near-expired medications or shortage medications to locations where they will be used soonest. Enhanced documentation and reporting also enable the pharmacy to be proactive and avoid stockouts while meeting ordering needs.

## Ledger Tools for Improved Financial Control

Pharmacies can accumulate too many high-cost, low-use medications, which may result in excessive medication spend due to lack of insight into real-time inventory positions.

EMM's General Ledger maintenance is designed to provide significant cost savings through inventory optimization. Site-to-site transfer capabilities with audit trails also provide the ability to quickly move high-cost, low-use medications when necessary.

EMM is designed to provide health systems with the tools necessary to actively manage and optimize medication inventory, helping you support the service levels nurses expect and patients deserve.
