

How Can You Better Manage Patient-Specific Medications?

SinglePointe Patient Medication Management Software

With most automated dispensing systems, patient-specific, patient-supplied, or infrequently used items must be handled and tracked manually. This creates extra work for pharmacy and nursing—and increases the risk of loss, diversion, missing doses, and even potentially fatal medication errors.

Omnicell® SinglePointe™ Patient Medication Management Software is the only solution for handling up to 100% of a patient's medications within the automated dispensing cabinet. SinglePointe automatically assigns each patient's medications to the cabinet, where they are stored in a patient-specific location. Nurses simply follow the Guiding Lights on the cabinet as they do to remove other medications. SinglePointe revolutionizes the way patient-specific medications are managed—greatly reducing the risk of medication errors while increasing clinical efficiency.

Single Point of Access for All Medications

- Improves patient safety by ensuring medications are removed against a profiled order
- Reduces expenses caused by misplaced or lost medications
- Saves nurses time spent tracking down medications from multiple locations

Proven Results

Healthcare facilities have achieved¹:

- 50% decrease in restock time
- 30% decrease in missing doses
- 80% decrease in returns/credits
- 76% decrease in potential medication errors

Manage More Medications in the Cabinet

SinglePointe Patient Medication Management Software provides a smarter way to manage medications not typically stocked in the automated dispensing cabinet, such as:

- Infrequently used medications on a nursing unit
- Patient-specific multi-use items (eye drops, creams, inhalers), IV admixtures, and other multi-component medication orders
- Patient's medications brought from home
- Non-formulary medications

The integrated Medication Label Printer on Omnicell cabinets enables patient-specific medications to be labeled as soon as they are removed.

Improve Inventory Management and Control

By assigning each patient's medications to the automated dispensing cabinet, SinglePointe eliminates the labor-intensive bin load/unload process. It can be configured to automatically assign locations based on medication type, providing greater inventory control:

- Controlled substances and high-value medications are assigned to metal locking lid drawers for greater security
- Refrigerated medications are assigned to refrigerators

Additional SinglePointe Benefits

- Speeds availability of medications when patients transfer
- Reduces the chances of discontinued medications being administered
- Streamlines process for managing medications when patients are discharged
- Tracks inventory through the automated dispensing cabinet, providing a complete audit trail
- Calculates restock levels automatically
