

How Can You Ensure Patients Have Critical Supplies When Needed?

OptiFlex Medical Surgical Supply Chain Management

When consumable supplies are not available when and where needed for patients, it slows down nurses and can ultimately impact the patient experience.

OptiFlex™ Medical Surgical is a complete supply chain system that captures real-time point-of-use data, enabling you to accurately track supply inventory and procedures by physician. By automating the replenishment process, this system saves time for materials management staff. It incorporates reorder points, par levels, and critical level alerts.

Track Inventory and Costs

This flexible system reduces costs by keeping inventory levels to a minimum, managing items stored in open shelving areas and secure, automated cabinets. As nurses use supplies, the inventory on hand is updated in the software.

- Ensures supply items are always on hand
- Lowers costs by reducing inventory levels and increasing inventory turns
- Increases revenue by ensuring consistent and accurate charging
- Improves overall efficiency for materials management and nursing staff

Reduces Bottlenecks for Nurses

- Nurse simply scans a barcode or pushes a button when removing supplies
- Usage and patient charges are automatically tracked, eliminating the need for manual documentation
- Eliminates need for charge stickers or “tick sheets”
- Identifies GS1 and HIBC barcodes as well as non-standard barcodes
